PINDEX2 is a binary vector designed for glucocorticoid-inducible gene expression in plants and is optimized for use in rice; pINDE is part of a series of four pINDEX vectors (Genbank Accession Numbers AF294979-AF294982). pINDEX vectors are based on parts of pCAMBIA-1300 encoded by GenBank Accession Number AF234296 and pTA7002 (Aoyama, T. and Chua N.-H., 1997, Plant J. 11:605-612).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Direct Submission

The nucleotide sequence of this BAC clone was generated by
combining Monsanto and RGP-Japan sequencing data.
NOTE: It currently consists of 1 contigs. Gaps between the contigs
are represented as runs of N. The order of the pieces is believed
to be correct as given, however the sizes of the gaps between them
are based on estimates that have provided by the submitter. This
sequence will be replaced by the finished sequence as soon as it is
available and the accession number will be preserved.
* NOTE: This is a 'working draft' sequence.

* This sequence will be replaced

* by the finished sequence as soon as it is available and
the accession number will be preserved.

* The facession number will be preserved.

* the accession number will be preserved.

(http://www.tigr.org/software/glimmerm/), BlASTN and BLASTX. The genomic sequence was searched against NCBI NonRedundant Protein database, nr (ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA sequence database at RGP or DDBJ. Protein homologies of the coding regions were searched against NCBI NonRedundant Protein database with BLASTN with the corresponding DDBJ accession no. and RGP clone ID. Full-length cDNAs represent the identified cDNA sequences using BLASTN with the corresponding DDBJ accession no. A gene with identity or significant homology to a protein is classified based on the protein name to indicate the homology level such as same name, 'putative-' and '-like protein'. A gene without significant homology to any protein but with full-length cDNA or EST homology (covering almost the entire length of partial sequence) is classified as an 'unknown' protein. A gene predicted by two or more gene prediction programs is classified as a 'hypothetical' protein according to IRGSP standard. A gene predicted by a single gene prediction program is also classified as a probable 'hypothetical' protein and is included as a probable 'hypothetical' protein and is included as a miscellaneous feature of the sequence.

The orientation of the sequence is from T7 to SP6 of the PAC clone. The sequence of possible of the sequence is from T7 to SP6 of the PAC clone. AP004990) clone at 5' end and with OSJNBB00044C15 (DDBJ: AP005850) at 3' end. Detailed information on overlap and assembly quality together with annotation of this entry is available at http://rgp.dna.affrc.go.jp/GenomeSeq.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (http://www.tigr.org/tdb/glimmerm/glmr_form.html), Ric (http://rgp.dna.affrc.go.jp/RiceHmm/), SplicePrediction(http://rgp.dna.affrc.go.jp/RiceHmm/), SplicePrediction(http://bioinformetics.iastate.edu/cgi-bin/sp.cgi), si(http://globin.cse.psu.edu/html/docs/sim4.html), gap2

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This invention relates to a novel isolated regulatory nucleic acid sequence that is useful in the field of plant molecular biology. Specifically, it refers to a regulatory gene of the rice GOS2 gene that can drive expression of an associated nucleic acid sequence in a non-monocotyledonous plant or plant cell. The present invention describes introducing a regulatory sequence that results in constitutive expression (with levels similar to that of CaMV 35S) of an isolated or endogenous

nucleic acid sequence in a transgenic non-monocotyledonous plant. In

Use of a regulatory nucleic acid associated nucleic acid sequence

sequence for driving expression
in a non-monocotyledonous plant

of an or plant

CGCCTATTTAATAC	57.7%; Score 1267; DB 3; Length 9361; Similarity 99.6%; Pred. No. 0;	comprised of 1010 bp of promoter and 170 bp of untranslated 5' leader interrupted by a 1100 bp intron sequence Sequence 9361 BP; 2449 A; 2285 C; 2190 G; 2435 T; 0 U; 2 Other;	transformation vector pGoS2-hpt, that contains a hygromycin selectable marker driven by the 35S promoter and a GoS2/GUS/nos cassette (GoS2 transcription intiation region/GUS structural gene/nos 3 untranslated region). The GoS2 transcription initiation region in this construct is	conserved sequence elements and structural features. They are about 300-2000 bp in length. Increased levels of expression of DNA introduced into plants can be achieved by use of MAR. They can also reduce the position effect in transgenic organisms. The present DNA segmence is the rice	(MAR) or scaffold attachment region, to increase the expression of genes introduced in transformed plants. MARs are located in non-transcribed regions of genes and form the physical boundaries of individual DNA loops. They are rich in adenosine and thymine bases and contain certain	Example 3; Page 48-51; 73pp; English.	An isolated DNA molecule for use as a matrix attachment region to increase expression of genes introduced in transformed plants comprises a 298 base pair sequence described in the specification. r increase expression of genes introduced in transformed plants comprises of 298 base pair sequence described in the specification.

Example 3; Page 51-54; 73pp; English.

The patent discloses a DNA molecule, useful as matrix attachment region CC (MAR) or scaffold attachment region, to increase the expression of genes controduced in transformed plants. MARs are located in non-transcribed CC introduced in transformed plants. MARs are located in non-transcribed CC regions of genes and form the physical boundaries of individual DNA CC loops. They are rich in adenosine and thymine bases and contain certain CC conserved sequence elements and structural features. They are about 300-CC 2000 bp in length. Increased levels of expression of DNA introduced into CC plants can be achieved by use of MAR. They can also reduce the position CC plants can be achieved by use of MAR. They can also reduce the position CC except that it contains a MAR dimer-2 positioned it the rice CC except that it contains a MAR dimer-2 positioned 3' to the GOS2 CC except that it contains a MAR dimer-2 positioned 3' to the COS2 CC except that it contains a MAR dimer-2 positioned 3' to the GOS2 CC except that it contains a MAR dimer-2 positioned 3' to the GOS2 CC except that it contains a MAR dimer-2 positioned 3' to the GOS2 CC except that it contains a MAR dimer-2 positioned 3' to the GOS2 CC except that it contains a MAR dimer-2 positioned 3' to the GOS2 CC except that it contains a MAR dimer-2 positioned 3' to the GOS2 CC except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC Except that it contains a MAR dimer-2 positioned 5' to the GOS2 CC CC Except that it contains a MAR d

Modifying plant growth and development for altering growth characteristics in plants, comprises introducing a genetic modification in the plant and selecting modulated expression of a nucleic acid encoding a metallothionein protein.

Claim 13; SEQ ID NO 7; 49pp; English

The invention relates to modifying plant growth and development and convolves introducing a genetic modification in the plant and selecting convolves introducing a genetic modification in the plant and selecting convolves introducing a nucleic acid encoding a convolves in protein, provided that the modified growth and convolves in protein, provided that the modified growth and convolves that the modified growth and convolves the modified growth and development; the modified plant growth and development is increased yield, preferably convolves a type plants. Genetic modification comprises introducing an increase of biomass and/or seed yield, when compared to corresponding wild type plants. Genetic modification comprises introducing an isolated convolved encoding a metallothionein protein into a plant. The nucleic acid encoding a metallothionein protein into a plant. The nucleic acid encoding a metallothionein protein into a plant. The nucleic acid encoding a metallothionein protein into a plant. The nucleic acid encoding a metallothionein is driven by a constitutive promoter, preferably the rice GOS2 promoter. The constitutive promoter, preferably the rice GOS2 promoter. The fragments, and the encoding polymucleotides are useful for modifying the growth characteristics of plants, provided that the modified growth and cevelopment is not increased metal accumulation or increased tolerance or resistance to abiotic stress. They are also useful as a growth regulator. The method is useful for modifying plant growth and development. It is also useful for producing plants with altered growth characteristics, ce given the provided that altered growth regulator. The present sequence represents the nucleotide sequence of casestic for the expression of A. thaliana Atm72a gene.

AXX PX-M
AXX P CC Improving plant growth characteristics, e.g. increased yield, increased CC growth rate, or modified architecture, comprises increasing expression in CC a plant of a nucleic acid encoding a B-type cyclin dependent kinase (CDK) crotein and/or increasing activity and/or levels in a plant of a B-type CC protein. INDEPENDENT CLAIMS are also included for: plants obtained cc using the method above, construct comprising (i) a B-type CDK grotein, construct comprising (i) a B-type CDK cc encoding a CR mutant, which CDK mutant protein, or (ii) a nucleic acid cc encoding a CDK mutant, which CDK mutant comprises at least one of the 7 cc amino acid position changes or at least one of the 8 amino acid position cc changes listed in the disclosure, (iii) one or more control sequences cc capable of driving expression of the nucleic acid of (i) or (ii), and coptionally (iv) a transcription termination sequence; a method for producing transgenic plant having improved growth characteristics, e.g. increased yield, increased growth rate, or modified architecture, which

B र् 밁 8 comprising aprotect consumptioning advanced by 1909; ill. opinion of active fragment, used as a growth regiliator; a screening method for identifying mutant plant CDRs having enhanced CDR activity relative to corresponding con-mattated plant CDRs, but are capable of binding to plant its mutant bind to the having enhanced CDR activity relative to corresponding con-mattated plant CDRs, but are capable of binding to plant its mutant bind to this object to the control of corresponding wild type plants; transgenic plant having improved growth characteristics, e.g. increased yield, increased growth rate, or modified architecture, the plant has increased expression of a B-type CDK nucleic acid and/or increased activity and/or levels in a plant of a B-type CDK growth characteristics are improved relative to growth characteristics

> 밁 S 닭

cc improved relative to growth characteristics of corresponding wild type plants, comprises introducing into a plant or a plant cell a B-type CDK cc gene/nucleic, or a nucleic acid encoding a CDK mutant comprising at least cone of the 7 amino acid position changes listed in the disclosure, and cultivating the plant cell under conditions promoting regeneration and cc activity relative to corresponding non-mutated plant CDKs corresponding non-mutated plant CDKs corresponding regeneration acid providing plant-derived CDK mutants, identifying mutants having cyclin-cc inhibitor (ICK) non reacting mutants, identifying mutants having cyclin-cc binding activity, and optionally a yeast complementation assay on cresultant mutants. Identifying substantially non-active plant CDKs, but are capable of binding to plant ICKs, comprises providing plant-derived CC CDK mutants, identifying plant-derived ICK binding mutants, and cc constitution. Preferred Transgenic Plant: The CDK mutants are provided by providing a wild type plant CDK and mutating the CDK at least 1 amino acid is useful for improving the growth characteristics of a plant, the growth characteristics is increased yield, increased growth rate, or modified

This gene can be used to produce plant tissue and/or morphologically normal fertile whole plants which are tolerant or resistant to glyphosate herbicide, and in the production of a herbicidal target for the high throughput in vitro screening of potential herbicides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
The invention relates to rice 5-enolpyruvylshikimate phosphate synthase (ERSPS) genomic DNA (AAC87188). The invention also relates to an expression cassette comprising, in the 5'-3' direction, one or more transcriptional enhancer elements selected from AAC87190-C87196), the rice BPSPS promoter, genomic DNA encoding a rice BPSPS chloroplast transit peptide, genomic DNA encoding a EPSPS protein modified such that it is resistant to glyphosate (AAC87189), and a transcriptional terminator. The glyphosate resistant EPSPS contains a region (AAB29793) containing two amino acid substitutions relative to the corresponding wild-type region (AAB29792). The invention also encompasses plant genomic BPSPS sequences identified via screening with a rice EPSPS intronic sequence; vectors and host plant cells comprising a nucleic acid sequence of the invention, optionally further transformed with a DNA encoding an insect, fungal, viral, bacterial,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29 APR-1999

nematode, stress or herbicide resistance protein; and methods of producing the transgenic plants of the invention. The nucleic acids and constructs of the invention are used to produce a wide variety of morphologically normal, glyphosate resistant plants. The glyphosate resistant plants produced are particularly maize, soybean, cotton, sugarbeet and canola, but also other field crops, fruits and vegetables, turf and forage grasses and nut-producing plants. The plants are optionally resistant to insects, fungi, viruses, bacteria, nematodes, stress, desiccation and/or other herbicides. They can be used in the production of a herbicidal target for the high throughput in vitro screening of potential herbicides. The present sequence represents an enhancer element which may be used in the rice EPSPS expression cassette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   33 CTAACTAACAATATAGGGAACGTGTGCTAAATATAAAATGAGACCTTATATATGTAGCGC

                                                                                                                                                                  characteristic when they are expressed in a plant. The DNA sequences of the invention are useful for producing plants with an altered metabolic characteristic, such as: altered acid metabolism, alcohol metabolism, fatty acid metabolism, branched fatty acid metabolism, alkaloid or other base metabolism, altered amino acid metabolism, altered ester metabolism, altered glyceride metabolism, altered phenolic metabolism, altered carbohydrate metabolism, altered sterol, oxygenated terpene, or isoprenoid metabolism, altered sterol, oxygenated terpene, or isoprenoid metabolism, altered sterol, oxygenated terpene, or metabolism, ketone or quinone metabolism. The DNA sequences of the invention may be used to provide disease resistance in a plant and gene shuffling or sexual PCR procedures. The present nucleic acid represents a plant and gene and the present of the invention may be used to provide disease.
                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; SEQ ID NO 2760; 2576pp; English

                                                                                                                                                                                             nucleic acid molecules that confer altered visual phenotypes in plants. Specifically, it refers to modifications of plant architecture and/or leaf surface features in plants, such as chlorotic, bleaching, etching, wet leaf, stunting, elongation and texture phenotypes, which are thought will be agronomic traits beneficial to the farmer. As such, these novel phenotypes can affect growth regulation i.e. useful for creating dwarf varieties, exhibit resistance to insects or heat stress, confer changes in pigment content such that plants have enhanced vitamin production or delayed senescence and also for example produce plants that control the production of ethylene. Furthermore, the present invention comprises generating transgenic plants, as well as reproducibly altering the visual phenotype of plant seeds, plant tissues and plant cells containing the polynucleotides described herein. This polynucleotide is a homologue of a base and altered visual phenotype when expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ds; visual phenotype; plant; architecture; leaf surface; c bleaching; etching; wet leaf; stunting; elongation; textur agronomic trait; growth regulation; dwarf variety; insect heat stress; transgenic.

The DNA sequences of the invention are useful for producing plants with an altered metabolic characteristic, such as: altered acid metabolism, alcohol metabolism, fatty acid metabolism, branched fatty acid metabolism, alkaloid or other base metabolism, altered amino acid metabolism, altered ester metabolism, altered glyceride metabolism, altered phenolic metabolism, altered carbohydrate metabolism, altered sterol, oxygenated terpene, or isoprenoid metabolism, altered sterol, oxygenated terpene, or isoprenoid metabolism, altered of sterol oxygenated terpene, or metabolism, ketone or quinone metabolism. The DNA sequences of the invention may be used to provide disease resistance in a plant and gene shuffling or sexual PCR procedures. The present nucleic acid represents a

                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to the identification and isolation of novel nucleic acid molecules that confer altered visual phenotypes in plants. Specifically, it refers to modifications of plant architecture and/or leaf surface features in plants, such as chlorotic, bleaching, etching, wet leaf, stunting, elongation and texture phenotypes, which are thought will be agronomic traits beneficial to the farmer. As such, these novel phenotypes can affect growth regulation i.e. useful for creating dwarf varieties, exhibit resistance to insects or heat stress, confer changes in pigment content such that plants have enhanced vitamin production or delayed senescence and also for example produce plants that control the production of ethylene. Furthermore, the present invention comprises generating transgenic plants, as well as reproducibly altering the visual phenotype of plant seeds, plant tissues and plant cells containing the polynucleotides described herein. This polynucleotide is a homologue of DNA sequence that confers an altered visual phenotype when expressed in plants, the method of the invention.
                                                                                                                                                                                                                                            Best Loc

The invention relates to plant nucleotide sequences that direct seed. CC leaf- and/or stem-, panicle-, root- or pollen-specific or -preferential CC or constitutive transcription of an operatively linked nucleic acid CC segment. The invention also relates to a method for augmenting a plant CC genome and a method of identifying a gene, where its expression is CC altered in the seed, leaf, stem, panicle, pollen, root or is constitutive in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower, CC canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley, CC sorghum, rice or wheat. The polymuclectides and the polypeptides they cencede are useful for manipulating crop plants to alter or improve CC phenotypic characteristics, to produce large quantities of oil or color incur resistance to insecticides, viruses or fungi, and to concern a high nutritional value with reduced apical dominance or dwarfism, coll or drought; to ensure the plants have a high nutritional value with reduced apical dominance or dwarfism, coll carly flowering or altered metabolic pathways. This sequence represents a collection of the invention. Note: The sequence data for this collection but was obtained in collectronic format directly from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Budworth

                                                                                                                                                                                                                           The present invention relates to a glyphosate resistant rice 5-
enolyyruvylshikimate phosphate synthase (EPSPS) gene. This gene can be
used to produce plant tissue and/or morphologically normal fertile who
plants which are tolerant or resistant to glyphosate herbicide, and in
the production of a herbicidal target for the high throughput in vitro

CERSES) genomic DNA (AAC87188). The invention also relates to an CC expression cassette comprising, in the 5'-3' direction, one or more CC transcriptional enhancer elements selected from AAC87190-C87196), the CC rice EPSPS promoter, genomic DNA encoding a rice EPSPS chroroplast transit peptide, genomic DNA encoding a rice EPSPS chroroplast (CC transit peptide, genomic DNA encoding a EPSPS protein modified such that CC it is resistant to glyphosate (AAC87189), and a transcriptional CC terminator. The glyphosate resistant EPSPS contains a region (AAB29793) CC containing two amino acid substitutions relative to the corresponding CC wild-type region (AAB29792). The invention also encompasses plant genomic EPSPS sequence; vectors and host plants (end tissues and seeds thereof) CC sequence; vectors and host plants (end tissues and seeds thereof) CC comprising a nucleic acid sequence of the invention, potionally further CC transformed with a DNA encoding an insect, fungal, viral, bacterial, nematode, stress or herbicide resistance protein; and methods of CC morphologically normal, plants of the invention. The nucleic acids and CC constructs of the invention are used to produce a wide variety of CC morphologically normal, glyphosate resistant plants. The glyphosate cresistant plants produced are particularly malze, soybean, cotton, cc stress, desistant to insects, fungl, viruses, bacteria, nematodes, cotton and/or other herbicides. They can be used in the CC primers, designant to insects, fungl, viruses, bacteria, nematodes, cotton of a herbicidal target for the high throughput in vitro corresponded in an examplification of the high throughput in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         21-DEC-1999;

/note="Vector: pBACIndigo; Site_1: EcoRI; Site_2: EcoRI; Rice is the most important food crop in the world. Half of the world population, especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate.

Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55,296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/EST Resource Center (www.genome.clemson.edu)."
